Report Overview

An On-chip Spectrometer is a compact, integrated optical device designed to analyze and measure the spectral composition of light within a microchip. This innovative technology leverages the principles of spectroscopy to perform detailed analysis of light sources, such as identifying chemical compounds, monitoring environmental conditions, or assessing the quality of materials. The on-chip spectrometer typically consists of a light input, a diffraction grating or other dispersive element to separate the light into its constituent wavelengths, and an array of photodetectors to measure the intensity of each wavelength. By integrating these components onto a single chip, the on-chip spectrometer offers a highly miniaturized, cost-effective, and portable solution for spectral analysis, making it suitable for a wide range of applications from scientific research to industrial quality control and consumer electronics.
