### Report Overview

The Onshore Wellhead System is a critical component of the oil and gas industry, specifically designed for onshore drilling and production operations. This system encompasses a comprehensive set of equipment and components that are installed at the surface of a well to control, monitor, and safely manage the flow of hydrocarbons from the reservoir to the surface. It includes various valves, chokes, and other control devices that regulate the pressure and flow rate of the produced fluids. The wellhead system also ensures the safety of personnel and the environment by providing blowout prevention mechanisms, such as blowout preventers, which can seal off the well in case of an emergency. Additionally, it may incorporate pressure gauges, flow meters, and other monitoring equipment to facilitate real-time data collection and analysis. The design and configuration of an onshore wellhead system can vary depending on the specific requirements of the well, such as the type of reservoir, production rates, and environmental conditions.
