Report Overview

Open Ocean Aquaculture refers to the practice of cultivating marine species, such as fish, shellfish, and seaweed, in open water environments, typically in the ocean. This method of aquaculture is distinct from land-based or closed-system farming, where water is controlled and contained. Open Ocean Aquaculture involves the use of floating structures, nets, or cages that are anchored in deeper waters, allowing for the natural flow of ocean currents to provide nutrients and maintain water quality. This approach aims to minimize environmental impacts, such as pollution and disease transmission, while also taking advantage of the vast space and natural conditions of the open ocean to support the growth of aquatic organisms. It is an important component of sustainable seafood production, as it can help meet the growing global demand for seafood while reducing pressure on wild fish stocks.
