Report Overview

Ophthalmic heavy water, also known as deuterium oxide (D₂O) for ophthalmic use, is a specialized form of water where hydrogen atoms are replaced by deuterium, a stable isotope of hydrogen. This modification alters the physical and chemical properties of water, making it particularly useful in medical and diagnostic applications within ophthalmology. It is primarily employed in procedures such as corneal hydration studies, where its unique properties help in assessing tear film dynamics and corneal permeability. Additionally, ophthalmic heavy water is utilized in advanced imaging techniques like deuterium magnetic resonance spectroscopy (DMRS) to study metabolic processes in ocular tissues. The product is highly purified to meet pharmaceutical standards, ensuring safety and efficacy in clinical applications. Its niche but critical role in ophthalmology research and diagnostics underscores its importance in advancing understanding and treatment of ocular diseases.
