Abstracts

The optical motion capture system is based on the principle of computer vision. Multiple high-speed cameras monitor and track target feature points from different angles, and combine with skeleton solving algorithms to complete motion capture. Theoretically, for any point in space, as long as it can be seen by more than two cameras at the same time, the 3D position of the point in space at that moment can be determined. When the camera shoots continuously at a high frame rate, the motion trajectory of the point can be obtained from the image sequence.

The global Optical 3D Motion Motion Capture System market size was estimated at USD 215.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
