Abstracts

Optical incremental rotary encoder is an instrument for measuring rotational motion, which converts the rotation Angle into an electrical signal output through components such as optical sensors and gratings. Unlike absolute encoders, incremental encoders output the amount of change in relative position or rotation Angle, usually requiring a reference point for the starting position. Optical incremental rotary encoders are suitable for applications where information such as rotation speed, position and direction need to be measured.

The global Optical Incremental Rotary Encoder market size was estimated at USD 450.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
