Report Overview

Diabetes is a chronic disease that occurs when the body cannot effectively use the produced insulin or the pancreas does not produce sufficient insulin. The pancreas is an organ that sits behind the stomach and releases hormones into the digestive system. Diabetes is categorized by increased levels of blood glucose, which can cause severe damage to blood vessels, heart, kidneys, nerves, and eyes. Diabetes is also called hyperglycemia or raised blood sugar. Insulin is a hormone that regulates the blood sugar level in body. Continuous increase in blood sugar leads to diabetes.

Uncontrollable diabetes can damage the nervous system and other body systems. Diabetes is of two types: type 1 and type 2. Type 1 diabetes, also known as juvenile diabetes or insulin-dependent diabetes, arises when the immune system misguidedly attacks and kills the beta cells of the pancreas. In type 1 diabetes, little or no insulin is released into the body, owing to this sugar builds up in the blood instead of being used as energy. Type 1 diabetes is rare, and only 10% of people with diabetes have type 1 diabetes. It commonly occurs in childhood or adolescence. Type 2 diabetes arises when the body cannot appropriately use the insulin that is released or does not make enough insulin. As a consequence, sugar builds up in the blood instead of being used as energy. About 90% of people with diabetes have type 2 diabetes.
