## Abstracts

Oral Parkinson's disease medications are drugs taken by mouth to manage the symptoms of Parkinson's disease, a neurodegenerative disorder characterized by motor symptoms such as tremors, stiffness, and bradykinesia (slowed movements). The primary oral medication is levodopa, often combined with carbidopa, which helps increase dopamine levels in the brain and improve motor function. Other oral medications include dopamine agonists (e.g., pramipexole, ropinirole) that mimic dopamine effects, MAO-B inhibitors (e.g., selegiline, rasagiline) that prevent dopamine breakdown, and COMT inhibitors (e.g., entacapone) that prolong the effect of levodopa. Anticholinergics (e.g., benztropine) and amantadine are also used to manage specific symptoms. These medications aim to reduce symptoms, improve quality of life, and enhance daily functioning, although they do not cure the disease or stop its progression.

The global Oral Parkinson S Disease Medications market size was estimated at USD 3650.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
