Abstracts

Organ perfusion and preservation focus on maintaining the viability of donor organs during the critical period between retrieval and transplantation. These products include both preservation devices and preservation solutions. Preservation devices, such as the LifePort Kidney Transporter and the VitaSmart Machine Perfusion System, use hypothermic perfusion techniques to circulate preservation solutions through the organs at controlled temperatures, minimizing cellular damage and extending viability. These devices often incorporate advanced features such as real-time monitoring of organ conditions and GPS tracking during transport to ensure optimal preservation conditions. Preservation solutions are specially formulated fluids that help maintain the organ's metabolic activity at a reduced rate, thus preserving its function. These solutions are used for both static cold storage and machine perfusion, depending on the organ type and preservation requirements. Together, these technologies play a crucial role in improving transplantation outcomes by reducing organ discard rates and enhancing the quality of transplanted organs.

The global Organ Perfusion and Preservation market size was estimated at USD 262.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
