Report Overview

Bee pollen is a type of pollen ball that has been packed by worker honeybees into pellets. Bee bread is also the bee pollen with extra honey and bee secretions and put in storage of brood cells. Chambers of honeybees or of wood and mud created by female ground-nesting (such as the Leaf cutting Bee) bees. With the Leaf cutting Bee, when the pollen ball is complete, a single female lays an egg on top of the pollen ball, and seals the brood cell. Pollen balls are harvested as food for humans. Bee pollen is sometimes referred to as ambrosia. Whereas with Honeybees, the thing to keep in mind is that the forager bees that gather pollen do not eat it themselves, since when they transition to seeking, they stop producing the proteolytic enzymes which is essential to digest it. So the foragers unload the pollen they've gathered directly into open cells located at the interface between the brood and stored honey, creating a typical band of what is called beebread - the material which is the main food source for honey bee larvae and workers. Bee pollen boosts brain greatly, lifting brain fatigue, improving alertness and helping concentration levels over an extended period of time. Rich in the vitamins of B1, B2 and B3 ? these are necessary for a healthy nervous system and powerful detoxifiers, especially to the brain. They are often referred to as ?anti-stress? or ?morale? vitamins - when the nervous system is working optimally anxiety and stress can be greatly lessened.
