Abstracts

The organic electron transport layer (ETL) is a component of organic electronic devices such as organic light-emitting diodes (OLEDs) and organic photovoltaic (OPV) cells. The primary function of the ETL is to facilitate the transport of electrons from the active layer (the layer where light emission or energy conversion occurs) to the cathode, while also acting as a barrier to holes (positively charged particles) to prevent them from recombining with electrons prematurely.

The global Organic Electron Transport Layer Etl market size was estimated at USD 145.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
