Abstracts

Osteodontokeratoplasty (OOKP), also known as 'tooth for eye', is a unique corneal transplantation technique. The principle of Osteodontokeratoplasty is to transfer the root of the patient's tooth and part of the surrounding bone and ligaments to the eye to fix a small transparent plastic cylinder (i.e. artificial cornea). The surgical process is divided into two stages. In the first stage, the doctor first removes one of the patient's canine teeth and the surrounding bones and ligaments, then repairs the tooth into a bolt shape, drills a hole in the middle, inserts an artificial cornea, and then implants the artificial cornea into the patient's cheek to cultivate new blood vessels. In the second stage, three to six months later, the complex with soft tissue growth is removed and sutured to the surface of the patient's eye. Patients who undergo this operation are usually completely blind people who cannot restore their vision through traditional corneal transplantation surgery, or patients who have lost their vision due to severe damage to the cornea and eyelids. However, the technology cannot restore vision to patients who have lost their sight due to damage to the optic nerve or retina.

The global Osteodontostomy And Artificial Keratoplasty market size was estimated at USD 385.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
