## Abstracts

From the view of electrolyte, the use of overcharge protective additives is an effective way to alleviate and slow down the rise of overpotential. When lithium-ion batteries are overcharged, a series of reactions will occur. The electrolyte components (mainly solvents) undergo irreversible oxidation and decomposition reactions on the surface of the positive electrode, generating gas and releasing a large amount of heat, which leads to an increase in the internal pressure and temperature of the battery, which has a serious impact on the safety of the battery. In terms of mechanism of action, overcharge protection additives are mainly divided into two types: redox shuttle type and electropolymerization type. In terms of additive type, they can be divided into lithium halides and metallocene compounds.

The global Overcharge Protection Additives market size was estimated at USD 106.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 26.00% during the forecast period.
