Report Overview

An oxygen generator molecular sieve is a component within an oxygen generation system that utilizes a process known as pressure swing adsorption (PSA) or vacuum swing adsorption (VSA). The molecular sieve is typically a zeolite material with a high affinity for nitrogen. During the adsorption phase, the sieve selectively captures nitrogen from ambient air, allowing oxygen to pass through. Subsequently, during the desorption phase, the pressure is reduced, releasing the captured nitrogen and regenerating the molecular sieve for the next adsorption cycle. This technology enables the production of high-purity oxygen from air by selectively removing nitrogen, making it valuable for medical, industrial, and other applications where a controlled oxygen supply is essential.
