Report Overview

Polyanionic Celluloses (PAC) and Carboxymethyl Cellulose (CMC) are high-performance water-soluble polymers widely used in the oil drilling industry. PAC is a type of cellulose ether derivative that forms high-viscosity solutions, enhancing the performance of drilling fluids by improving their suspension and filtration control properties. This results in better hole cleaning, reduced torque and drag, and improved drilling efficiency. On the other hand, CMC is a cellulose derivative with carboxyl groups that provide excellent thickening and water retention properties. It is used as a drilling fluid additive to increase viscosity, improve rheological stability, and enhance the carrying capacity of the drilling fluid. Both PAC and CMC play crucial roles in optimizing drilling operations, ensuring efficient wellbore construction, and maintaining the integrity of the drilling equipment.
