Abstracts

In the context of HBM, packaging filler refers to materials used to fill gaps, voids, or spaces within the memory package, typically in 3D stacked memory configurations. These fillers are strategically placed between the layers of stacked memory dies, between the memory die and the substrate, or around the interconnects to enhance the mechanical properties and performance of the final product. As the need for faster and more efficient data processing grows, industries are increasingly turning to HBM to meet their high-performance computing demands. HBM provides higher bandwidth, lower power consumption, and a more compact form factor compared to traditional memory technologies like DDR (Double Data Rate) DRAM. These attributes are critical for AI and ML workloads, where large amounts of data are processed simultaneously. The use of HBM in servers, GPUs, and networking equipment, which power AI models and big data analytics, has pushed demand for efficient, reliable packaging solutions. Packaging fillers, which are used to fill the gaps between the components of the memory stack in HBM systems, are integral in ensuring thermal management, mechanical stability, and electrical performance. As more industries adopt AI and HPC technologies, the demand for HBM and its associated packaging components, including fillers, is likely to expand significantly.

The global Packaging Filler for HBM market size was estimated at USD 780.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 42.00% during the forecast period.
