Report Overview

A Palm Aneroid Sphygmomanometer is a type of manual blood pressure monitoring device that consists of a cuff, a bulb for inflating the cuff, a pressure dial or gauge to display the blood pressure readings, and a stethoscope. This type of sphygmomanometer is typically used by healthcare professionals to measure blood pressure in patients. The process of using a Palm Aneroid Sphygmomanometer involves wrapping the cuff around the upper arm, inflating the cuff using the bulb to a pressure that temporarily stops blood flow in the artery, and then slowly releasing the pressure while listening with the stethoscope for the sounds of blood flow in the artery (Korotkoff sounds). The systolic pressure (the pressure in the arteries when the heart beats) and diastolic pressure (the pressure in the arteries when the heart is at rest) can be determined by monitoring the pressure gauge and listening for specific sounds during the process.
