Report Overview

Para-Dodecylphenol, also known as 4-Dodecylphenol or 4-n-Dodecylphenol, is an organic compound that belongs to the class of alkylphenols. It is characterized by a phenol molecule with a dodecyl (C₁₂H₂₅) alkyl chain attached to the para (4th) position of the phenol ring. This compound is primarily used as an intermediate in the production of various chemical products, including surfactants, antioxidants, and polymers. Para-Dodecylphenol is known for its amphiphilic properties, which means it has both hydrophilic (water-attracting) and hydrophobic (water-repelling) characteristics. These properties make it useful in applications that require the interaction between water and oil, such as in emulsification, wetting agents, and dispersing agents. The compound is also recognized for its potential environmental impact, as some alkylphenols can be persistent and bioaccumulative in the environment, leading to concerns about their use in certain applications.
