### Report Overview

Para-Nonylphenol (PNP) is an organic compound that belongs to the class of alkylphenols. It is a colorless, viscous liquid with a slight phenolic odor. PNP is primarily used as a precursor in the synthesis of various non-ionic surfactants, which are widely employed in the production of detergents, emulsifiers, and dispersants. These surfactants are known for their ability to reduce surface tension in water, making them effective in cleaning and stabilizing applications. PNP is also utilized in the manufacturing of polymers, lubricants, and pesticides. However, due to its potential environmental and health concerns, including endocrine disruption and persistence in the environment, the use of PNP and its derivatives has been restricted or banned in several countries. The compound is characterized by its molecular formula  $C_{15}H_{24}O$ , with a nonyl group (a nine-carbon alkyl chain) attached to a phenol group.
