### Report Overview

Parkinson's Disease (PD) is a progressive neurological disorder that affects the central nervous system, primarily impacting the motor system. Characterized by the degeneration of dopamine-producing neurons in the brain, it leads to a range of symptoms that include tremors, muscle rigidity, slowness of movement (bradykinesia), and postural instability. The disease is named after Dr. James Parkinson, who first described it in 1817. PD is caused by a combination of genetic and environmental factors, and there is currently no cure. Treatment focuses on managing symptoms and improving quality of life through medication, physical therapy, and surgical interventions when necessary.
