Report Overview

The passive magnetic pickup is a type of transducer used primarily in musical instruments, such as electric guitars and basses, to convert string vibrations into electrical signals without requiring an external power source. Unlike active pickups, which rely on batteries or external power to amplify the signal, passive magnetic pickups generate voltage directly through electromagnetic induction, where the movement of metal strings within a magnetic field induces a current in coiled wire. These pickups are known for their warm, dynamic tone and simplicity, making them a staple in genres like blues, rock, and jazz. They typically consist of magnets (often Alnico or ceramic) wrapped with thousands of turns of fine copper wire, housed in a bobbin, and their output is influenced by factors like magnet strength, coil winding, and string composition. While they offer a classic sound, they can be susceptible to electromagnetic interference and have lower output compared to active alternatives, making them less common in high-gain or modern metal applications. The market for passive magnetic pickups remains robust due to their enduring popularity among traditionalists and their cost-effectiveness in manufacturing.
