### Report Overview

The passive magnetic soundhole pickup is a type of guitar pickup designed to amplify acoustic guitars without requiring an external power source, relying instead on electromagnetic induction to convert string vibrations into electrical signals. Positioned in the soundhole, it captures the magnetic fluctuations of vibrating steel strings, making it ideal for live performances where simplicity and quick installation are valued. Unlike active pickups, passive models do not need batteries or preamps, offering a more straightforward setup but often with lower output and less tonal shaping capability. They are favored by musicians seeking a natural, uncolored acoustic tone with minimal interference to the guitar's acoustic properties. The market for passive magnetic soundhole pickups caters to both professional and amateur guitarists who prioritize convenience, durability, and affordability while maintaining a balanced sound output suitable for various musical genres.
