Report Overview

A Passive Vibrating Mesh Nebulizer (pVMN) is a medical device used for the administration of aerosolized medications, particularly for patients with respiratory conditions such as asthma, chronic obstructive pulmonary disease (COPD), and cystic fibrosis. This device functions by utilizing a mesh or plate with small holes, which vibrates at ultrasonic frequencies to create a fine mist of medication. The passive aspect refers to the fact that the device does not require an external power source, as it is driven by the patient's own inhalation, which creates the necessary airflow to activate the mesh. This makes pVMNs portable, convenient, and suitable for home use. The nebulizer's design allows for efficient drug delivery, with minimal drug waste, and it offers a quieter operation compared to traditional compressor-driven nebulizers. The pVMN's compact size and ease of use make it an attractive option for patients who require frequent nebulizer treatments.
