### Report Overview

PDMS Microfluidic Devices refer to microfluidic systems that are fabricated using Polydimethylsiloxane (PDMS), a widely used silicone-based polymer. These devices are engineered to manipulate and control small volumes of fluids, typically in the microliter to picoliter range, within microscale channels and chambers. They are designed for a variety of applications, including chemical analysis, biological assays, drug discovery, and lab-on-a-chip technologies. PDMS is favored for its biocompatibility, optical transparency, gas permeability, and the ability to replicate high-resolution features from masters, such as those created through photolithography. PDMS microfluidic devices offer advantages like ease of fabrication, low cost, and the possibility of integrating multiple functions on a single platform, making them a versatile tool in both research and commercial applications.
