### Report Overview

A pedal travel sensor is an electronic device that is used to measure the position of the accelerator pedal in a vehicle. It is also known as an accelerator pedal position (APP) sensor or throttle position sensor (TPS). The sensor works by detecting the movement of the pedal and converting it into an electrical signal that is sent to the vehicle's electronic control module (ECM). The ECM then uses this signal to control the throttle valve and regulate the amount of air and fuel entering the engine. The pedal travel sensor is a critical component of a vehicle's engine management system, as it helps to ensure that the engine is running efficiently and smoothly.
