Report Overview

PEEK (polyetheretherketone) bone joint interface screws are high-performance medical implants used in orthopedic and spinal surgeries to stabilize joints or fuse bones. These screws are made from PEEK, a biocompatible, radiolucent polymer that offers superior strength, durability, and resistance to wear compared to traditional metal implants. Their radiolucency allows for better post-operative imaging, while their modulus of elasticity closely matches that of human bone, reducing stress shielding and promoting natural bone healing. PEEK screws are commonly used in procedures like ACL reconstruction, spinal fusion, and trauma fixation, where their lightweight, corrosion-resistant, and MRI-compatible properties make them advantageous over titanium or stainless steel alternatives. The demand for these implants is driven by the growing prevalence of musculoskeletal disorders, an aging population, and advancements in minimally invasive surgical techniques.
