Report Overview

The PEG (Percutaneous Endoscopic Gastrostomy) Kit is a medical device designed for the placement of a feeding tube directly into the stomach through the abdominal wall, using an endoscopic procedure. It is primarily used for patients who require long-term enteral nutrition due to conditions such as dysphagia, neurological disorders, or cancer, ensuring safe and efficient delivery of nutrients when oral intake is insufficient or impossible. The kit typically includes components like a gastrostomy tube, introducer needle, guidewire, dilator, and securing devices, all designed to facilitate a minimally invasive procedure. PEG kits are widely adopted in hospitals, long-term care facilities, and home healthcare settings, with demand driven by an aging population, rising prevalence of chronic diseases, and advancements in endoscopic techniques. Market growth is further supported by increasing awareness of enteral nutrition benefits over parenteral alternatives, though cost constraints and procedural risks may pose challenges in certain regions.
