Abstracts

The Pencil Beam DEXA Bone Densitometer is a type of bone densitometry system that uses a pencil-thin beam of X-rays to measure bone mineral density. This technology is similar to conventional DEXA, but instead of using a fan-shaped beam, it uses a thin, linear beam that scans across the bone being assessed. Pencil Beam DEXA systems are generally more accurate in measuring bone mineral density than conventional DEXA systems, particularly in patients who have a higher degree of obesity or who have significant scoliosis or other spinal deformities. They are also better able to detect small changes in bone mineral density over time, which can be useful for monitoring the effectiveness of treatments for osteoporosis and related conditions. However, Pencil Beam DEXA systems are generally more expensive and less widely available than conventional DEXA systems, which may limit their use in some clinical settings.

The global Pencil Beam DEXA Bone Densitometer market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
