Abstracts

Peptide-Radionuclide Conjugates (PRCs) are advanced therapeutic and diagnostic tools used in nuclear medicine that combine a peptide, which specifically binds to certain receptors on cancer cells, with a radionuclide, which emits radiation. The peptide component targets and binds to receptors that are overexpressed on the surface of tumor cells, such as somatostatin receptors in neuroendocrine tumors. The attached radionuclide then emits either beta or alpha particles, which deliver targeted radiation directly to the cancer cells, leading to their destruction. This combination allows for highly specific treatment of cancerous tissues while minimizing damage to surrounding healthy tissues, making PRCs valuable in both imaging (for diagnosis) and therapy (for treatment).

The global Peptide Radionuclide Conjugates Prcs market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.35% during the forecast period.
