Abstracts

Perfusion resin for wind turbine blades is a specialized material used in the manufacturing process to enhance the structural integrity and performance of the blades. It is designed to impregnate and reinforce the internal structure of the blade with high-strength fibers, such as carbon or glass, resulting in increased stiffness and durability. The perfusion resin is commonly applied through a vacuum infusion process, allowing for uniform distribution of the resin within the blade's core. This improves the blade's overall strength, reduces the risk of delamination, and enhances its resistance to fatigue and environmental factors. Wind turbine manufacturers rely on perfusion resin to ensure reliable and efficient operation of the blades in various wind conditions.

The global Perfusion Resin For Wind Turbine Blades market size was estimated at USD 145.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
