Report Overview

The periodontal disease model is a specialized medical or dental tool designed to simulate the progression, symptoms, and anatomical changes associated with periodontal (gum) disease, which includes conditions such as gingivitis and periodontitis. These models are commonly used for educational purposes in dental schools, clinical training, and patient demonstrations to illustrate the effects of plaque buildup, gum recession, bone loss, and tooth mobility. They typically replicate human oral structures, including teeth, gums, and underlying bone, often with detachable or adjustable components to showcase different stages of the disease. Advanced models may incorporate interactive or 3D-printed elements to enhance realism, aiding in both professional training and patient awareness campaigns. The demand for these models is driven by the increasing prevalence of periodontal diseases globally, advancements in dental education technology, and the growing emphasis on preventive oral care. Key market players include medical simulation companies, dental equipment manufacturers, and educational institutions investing in innovative training tools. The market is also influenced by regulatory standards for medical training devices and the rising adoption of digital dentistry solutions.
