Report Overview

A Periodontal Ligamentotomy Device is a specialized dental instrument designed to perform a minimally invasive surgical procedure known as ligamentotomy. This procedure involves the precise cutting of the periodontal ligament fibers that connect the tooth to the surrounding bone, without removing any bone or damaging the tooth structure. The device is typically used in periodontal therapy to treat gum disease or to facilitate tooth movement in orthodontic treatments. By selectively severing the fibers, the device allows for controlled tooth movement and can help in reducing the risk of periodontal damage. It is an advanced tool that requires skill and precision from dental professionals to ensure effective treatment outcomes and patient safety.
