Report Overview

Peripheral Liquid Embolic Agents (PLEAs) are medical devices used in interventional radiology and neuroradiology procedures to occlude blood vessels, particularly in the treatment of peripheral artery aneurysms, arteriovenous malformations, and certain types of fistulas. These agents are typically composed of a liquid or semi-solid material that can be injected into the blood vessel, where it hardens upon contact with blood, effectively blocking blood flow to the targeted area. PLEAs are designed to be non-adhesive to the delivery catheter, allowing for precise placement and minimizing the risk of vessel damage. They are often used as an alternative to traditional coil embolization, offering advantages such as faster occlusion and the ability to treat wide-necked or complex vascular structures. The selection of a specific PLEA depends on factors like the size and location of the target vessel, as well as the desired permanence of the occlusion.
