Abstracts

The most important structural feature of the peristaltic pump high-pressure syringe is that there is no syringe to contain contrast media and physiological saline. The liquid driving method of the peristaltic pump high-pressure syringe is completely different from that of the syringe high-pressure syringe. The peristaltic pump injection method applies driving force outside the pipeline to push the physiological saline or contrast agent in the pipeline to achieve the injection action. The peristaltic pump consists of a drive motor, a pump tube and a pump head. The injection liquid flows in an isolated pump tube. It has the characteristics of quick replacement, controllable operation, and low maintenance costs.

The global Peristaltic Pump High Pressure Syringe market size was estimated at USD 860.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
