Abstracts

The permanent magnet iron removal filter has a long cylindrical structure with an external permanent magnet, which can easily enter and exit the cylinder through a pneumatic mechanism. Several filters composed of magnetophilic metal fibers are arranged in the magnetic field area inside the rectangular cylinder. During operation, the magnet magnetizes the filter element in the magnetic field area, so that the magnetic particles in the liquid to be filtered are adsorbed on the surface or inside of the filter element. When the filter element captures a certain amount of magnetic impurities, the filtration capacity will decrease.

The global Permanent Magnet Iron Removal Filter market size was estimated at USD 125.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
