Report Overview

The PES (polyethersulfone) hollow fiber dialyzer is a critical medical device used in hemodialysis to filter waste products, excess fluids, and toxins from the blood of patients with kidney failure. It consists of a bundle of hollow fibers made from PES, a biocompatible synthetic polymer known for its high permeability, mechanical strength, and resistance to protein adsorption, ensuring efficient solute removal and minimal inflammatory response. The hollow fiber structure maximizes surface area for diffusion and ultrafiltration, while the PES membrane's pore size is engineered to selectively remove uremic toxins while retaining essential proteins. These dialyzers are designed for single-use, adhering to strict sterility and safety standards, and are compatible with various dialysis machines. Their performance is measured by clearance rates for small and middle molecules, biocompatibility, and flux characteristics, making them a preferred choice in both acute and chronic dialysis treatments.
