Report Overview

Allergy to cats and dogs is extremely common and occurs in up to 25% of people with allergies. Cat allergies are twice as common as dog allergies. Cat allergens are produced in large amounts, particularly by male non-neutered cats. The allergens are partially under hormonal control. Cats produce a protein known as Fel d 1, which is allergenic to human beings when it is infected with bacteria or viruses. The infected protein is contained in a pet's urine, saliva, and skin. The dead skin of pets known as dander is regularly sloughed off and replaced by new skin cells. The dander can flake off from a pet's fur and become airborne. It can be carried on the clothing of people who have pets such as cats and dogs and then shed in public places. Therefore, pet allergens especially that of cats and dogs, are a component of house dust even in homes where cats and dogs have never lived.
