Abstracts

The server will be submerged to the low-viscosity, non-conductive coolant, through the direct contact between the coolant and the hot parts as well as the liquid cycle to take away the heat of the computing equipment; at the same time, due to the process of low-temperature evaporation of the liquid will be hot from the liquid pool transferred to the space outside the pool, through the condensing tube and other heat exchange devices, so that the vapour is again cooled and condensed to flow back to the water tank, and so on, and so forth, and constantly cycling. According to the survey, the current energy consumption in the GPU, CPU is getting bigger and bigger. In terms of GPU, the thermal power consumption (TDP) will reach 1500W in 2026; for CPU, the TDP will reach 800W in 2026, therefore, the era of kilowatt service cooling has come, and the submerged liquid cooling technology has become the optimal solution. The raw material of dual-phase immersion liquid is based on fluoride (perfluoropolyether and hydrofluoroether), and its production is complicated and very costly. At present, the price of mainstream 3M phase change coolant in the market is as high as 500,000 yuan/tonne. Downstream users are mainly concentrated in some industries with very high requirements for heat dissipation, such as data centres and energy storage systems. As more companies start related research, it is expected to reduce the overall cost in the future through technological advances and large-scale production, while expanding its application areas.

The global Phase Change Immersion Cooling Liquid market size was estimated at USD 245.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
