### Report Overview

Phase change liquid immersion cooling servers represent an advanced thermal management solution for data centers, leveraging the high heat absorption capacity of dielectric fluids to cool servers more efficiently than traditional air or water cooling methods. In this approach, servers are submerged in a non-conductive liquid that undergoes phase change (evaporation) when absorbing heat from components, with the vapor then condensed and recirculated in a closed-loop system. This technology significantly reduces energy consumption by eliminating the need for power-intensive fans and chillers while enabling higher-density server deployments. The market is driven by rising demand for sustainable, high-performance cooling solutions in hyperscale data centers, AI/ML workloads, and cryptocurrency mining, where heat dissipation challenges traditional cooling methods. Key players include immersion cooling specialists like Submer, LiquidStack, and GRC, alongside traditional server manufacturers integrating the technology. However, adoption faces barriers such as higher upfront costs, fluid maintenance requirements, and retrofit challenges for existing infrastructure. As global data center energy consumption grows, regulatory pressures and ESG commitments are accelerating the shift toward liquid cooling, positioning phase change immersion as a disruptive force in the \$2B+ data center cooling market with projected CAGR exceeding 20% through 2030.
