Abstracts

Phosphorus Oxychloride (POCl_3) is commonly used in the semiconductor industry for the diffusion process. In the diffusion process, POCl_3 is used as a dopant source to introduce phosphorus atoms into silicon wafers. During the diffusion process, the silicon wafers are exposed to a high-temperature environment, and POCl_3 is vaporized and introduced into the furnace. The phosphorus atoms from POCl_3 diffuse into the silicon lattice, creating a doped region with desired electrical properties. Phosphorus Oxychloride is preferred for diffusion because it provides a controlled and uniform doping profile. It is also compatible with the silicon wafer manufacturing process and can be easily removed after diffusion.

The global Phosphorus Oxychloride For Diffusion market size was estimated at USD 285.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
