Abstracts

Photo-radical polymerization initiators are compounds that, upon exposure to light (typically ultraviolet or visible light), generate free radicals which initiate the polymerization process of monomers. These initiators are used in photo-initiated polymerization reactions to create polymers with desired properties such as molecular weight, crosslinking density, and functionality. They play a crucial role in various applications including coatings, adhesives, 3D printing, and electronics manufacturing, where precise control over polymerization is required. Examples of photo-radical polymerization initiators include benzoin derivatives, benzophenone derivatives, and camphorquinone.

The global Photo Radical Polymerization Initiators market size was estimated at USD 350.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
