Report Overview

Photostimulable Phosphor (PSP) Systems are a type of digital imaging technology used primarily in medical, dental, veterinary, and industrial radiography. Unlike traditional X-ray film systems, PSP systems use reusable imaging plates made of phosphor material that store the image information when exposed to X-rays. After exposure, the imaging plate is scanned with a laser in a special reader, which releases the stored energy as light. This light is then captured and digitized to produce a high-resolution digital image. PSP systems combine the flexibility and familiarity of film-based radiography with the advantages of digital imaging, such as faster workflow, lower radiation doses, image enhancement, and easier storage and sharing. Their cost-effectiveness and reusability make them a popular choice in small-to-mid-sized imaging facilities.
