Report Overview

A Pirani Vacuum Transmitter is a type of vacuum gauge that measures the pressure of a gas in a vacuum environment. It is named after Marcello Pirani, who developed the technology in the early 20th century. The device operates on the principle of thermal conductivity, where a heated filament is exposed to the gas whose pressure is to be measured. As the gas pressure increases, the thermal conductivity of the gas also increases, causing the filament to cool down. By measuring the temperature of the filament and comparing it to a reference temperature, the Pirani Vacuum Transmitter can accurately determine the pressure of the gas. This device is widely used in various industries, including semiconductor manufacturing, vacuum coating, and scientific research, where precise vacuum measurements are essential.
