Report Overview

A Pixel Array Detector (PAD) is a sophisticated imaging technology that employs an array of individual pixels, each capable of detecting and processing light signals independently. This advanced detector is widely used in various applications, including medical imaging, such as X-ray and CT scans, as well as in scientific research and industrial inspection. Each pixel in the array functions as a mini-detector, capturing and converting incident radiation or light into electrical signals. These signals are then digitized and processed to create high-resolution images. The key features of a PAD include its high spatial resolution, fast data acquisition, and the ability to handle a large dynamic range of intensities. This technology allows for the precise localization of features within an image, which is crucial for accurate diagnosis and analysis in various fields.
