Report Overview

Plant Growth Factor (PGF) refers to a group of naturally occurring substances or synthetic compounds that significantly influence the growth, development, and overall health of plants. These factors can be hormones, enzymes, or other biochemicals that are either produced by the plants themselves or added externally to enhance plant growth. PGFs play a crucial role in various physiological processes such as cell division, elongation, differentiation, and organ development. They can also help in stress management, nutrient uptake, and resistance to diseases and environmental conditions. Examples of PGFs include auxins, gibberellins, cytokinins, and abscisic acid, which are naturally produced by plants, and synthetic growth regulators like growth hormones and plant growth stimulants used in agriculture to improve crop yield and quality.
