Report Overview

A Plasma Display Panel (PDP) is a type of flat panel display technology that utilizes gas plasma to create images. It consists of a matrix of tiny cells filled with a mixture of noble gases, such as neon and xenon, which are ionized by an electric field to produce ultraviolet light. This ultraviolet light then excites phosphor materials within the cells, causing them to emit visible light and create the image. PDPs are known for their high contrast ratios, wide color gamut, and fast refresh rates, making them suitable for large screen sizes and applications where high-quality video display is required. However, they have been largely replaced by other technologies such as LCD and LED displays due to their higher energy consumption and shorter lifespan.
