Report Overview

Plasma Rotating Electrode Atomization (PREA) Powder Making Equipment is an advanced manufacturing system used to produce high-quality spherical metal powders for additive manufacturing, thermal spray coatings, and other specialized applications. The process involves melting a rotating electrode using a plasma arc, with centrifugal force dispersing the molten material into fine droplets that solidify into spherical powder particles. This method is particularly valued for its ability to produce powders with excellent flowability, high purity, and uniform particle size distribution, making it ideal for critical industries like aerospace, biomedical, and energy. The equipment typically includes a plasma torch, rotating electrode mechanism, inert gas environment control, and powder collection system, ensuring consistent production of premium powders from refractory and reactive metals such as titanium, nickel, and cobalt alloys. Its adoption is driven by the growing demand for high-performance metal powders in 3D printing and surface engineering applications.
