Report Overview

Plastic external lubricants are additives used in polymer processing to reduce friction between the molten plastic and processing equipment, such as extruders or injection molding machines. These lubricants function by migrating to the surface of the polymer, forming a thin layer that minimizes adhesion and improves flow properties, ultimately enhancing production efficiency, surface finish, and mold release. They are commonly used in PVC, polyolefins, and engineering plastics, with key types including fatty acid amides, metallic stearates, and wax-based compounds. The market for plastic external lubricants is driven by the growing demand for high-performance plastics in automotive, packaging, construction, and consumer goods industries, where processing efficiency and product quality are critical. However, environmental concerns and regulatory restrictions on certain chemical additives may influence formulation trends toward bio-based or non-toxic alternatives. The competitive landscape includes major chemical manufacturers focusing on innovation and sustainability to meet evolving industry standards.
