Report Overview

A Plastic Fibre Optic Sensor is a type of sensor that utilizes plastic optical fibers to detect and measure various physical parameters such as temperature, pressure, and strain. These sensors are made from polymer materials, which offer advantages such as flexibility, lightweight, and resistance to electromagnetic interference. The core of the plastic fiber optic sensor is the plastic optical fiber, which guides light through the fiber by the principle of total internal reflection. When the fiber is subjected to external stimuli, the light signal is modified, and this change is detected and analyzed to determine the magnitude of the applied parameter. Plastic Fibre Optic Sensors are widely used in various industries, including aerospace, automotive, medical, and telecommunications, due to their robustness, cost-effectiveness, and ability to provide real-time monitoring in harsh environments.
