Report Overview

Plastic grade cellulose diacetate is a biodegradable and semi-synthetic polymer derived from cellulose, primarily sourced from wood pulp or cotton linters. It is chemically modified through acetylation to enhance its thermoplastic properties, making it suitable for molding, extrusion, and other plastic processing techniques. This material is valued for its clarity, high gloss, and excellent mechanical strength, as well as its resistance to oils and greases. Commonly used in eyewear frames, tool handles, packaging films, and consumer goods, cellulose diacetate is an eco-friendly alternative to petroleum-based plastics due to its renewable origins and biodegradability under specific conditions. However, its production involves solvents like acetone, which raises environmental and safety considerations. The market for plastic grade cellulose diacetate is driven by increasing demand for sustainable materials, regulatory pressures on single-use plastics, and growing consumer preference for bio-based products, though cost competitiveness with conventional plastics and processing limitations remain key challenges.
